ECE 459 Winter 2024 1/20

#### The Host Code

We've learned about how a kernel works and a bit about how to write one.

The next part is the host code.

Now, fortunately, we don't have to write the whole program in C++ or C, even though the kernel has to be written in the CUDA variant.

We're going to use the Rustacuda library!

ECE 459 Winter 2024 2/20

#### **Rust Host Code Example**

```
#[macro use]
extern crate rustacuda:
use rustacuda::prelude::*;
use std::error::Error;
use std::ffi::CString;
fn main() -> Result <(), Box<dyn Error>> {
    // Set up the context, load the module, and create a stream to run kernels
         in.
    rustacuda::init(CudaFlags::empty())?;
    let device = Device::get device(0)?;
    let ctx = Context::create and push(ContextFlags::MAP HOST | ContextFlags
         :: SCHED AUTO. device)?:
    let ptx = CString::new(include_str!("../resources/add.ptx"))?;
    let module = Module::load from string(&ptx)?:
    let stream = Stream::new(StreamFlags::DEFAULT, None)?;
    // Create buffers for data
    let mut in x = DeviceBuffer::from slice(&[1.0f32; 10])?;
    let mut in v = DeviceBuffer::from slice(&[2.0f32: 10])?:
    let mut out 1 = DeviceBuffer::from slice(&[0.0f32; 10])?;
```

ECE 459 Winter 2024 3/20

### Rust Host Code Example

```
// This kernel adds each element in 'in_x' and 'in_y' and writes the
                           result into 'out'.
unsafe {
                     // Launch the kernel with one block of one thread, no dynamic shared
                                                memory on 'stream'.
                       let result = launch! (module.sum<<<(1, 1, 1), (10, 1, 1), 0, stream>>>(1, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 1, 1), (10, 
                                            in x.as device ptr(),
                                            in_y.as_device_ptr(),
                                            out_1.as_device_ptr(),
                                            out 1.len()
                       ));
                      result?;
// Kernel launches are asynchronous, so we wait for the kernels to finish
                           executing.
stream.svnchronize()?:
```

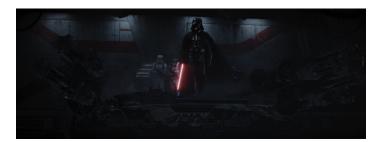

ECE 459 Winter 2024 4/20

## **Rust Host Code Example**

```
// Copy the results back to host memory
let mut out_host = [0.0f32; 20];
out_1.copy_to(&mut out_host[0..10])?;

for x in out_host.iter() {
    assert_eq!(3.0 as u32, *x as u32);
}

println!("Launched kernel successfully.");
Ok(())
```

ECE 459 Winter 2024 5/20

### **Corresponding Kernel**

```
extern "C" __constant__ int my_constant = 314;

extern "C" __global__ void sum(const float* x, const float* y, float* out, int count) {
   for (int i = blockIdx.x * blockDim.x + threadIdx.x; i < count; i += blockDim.x * gridDim.x) {
      out[i] = x[i] + y[i];
   }
}</pre>
```

ECE 459 Winter 2024 6/20

# N-Body Problem

Let's take a look at the N-Body Problem code in the repo.

ECE 459 Winter 2024 7/20

That's great, but how much does it speed up?

I ran this on ecetesla1.

With 100 000 points:

- nbody (sequential, no approximations): 40.3 seconds
- nbody-parallel (parallel, no approximations): 5.3 seconds
- nbody cuda (parallel, no approximations): 9.5 seconds

ECE 459 Winter 2024 8/20

#### Wait a Minute

That's worse than the CPU version.

ECE 459 Winter 2024 9/20

# Kylo Ren is very Meme-Able

Theory: 100 000 points is not enough to overcome the overhead of setup and transferring data to and from the device.

ECE 459 Winter 2024 10 / 20

# **Sequel Memes!**

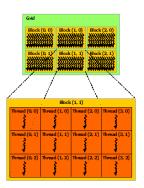

This turned out to be incorrect.

Most of the time was going to the kernel execution of the calculate\_forces—as expected?

ECE 459 Winter 2024 11 / 20

### This Was Important

The documentation isn't super great about how grids and blocks work.

A lot of the guidance on the internet says is "experiment and try".

ECE 459 Winter 2024 12/20

#### **Grid Guidance**

The initial approach that I wrote had each work-item be its own grid.

That's inefficient, because we're not taking advantage of all the hardware that's available (the warp hardware).

The advice that I can find says the number of threads per block should always be a multiple of 32 with a maximum of 512 (or perhaps 1024).

The second guidance I can find is that numbers like 256 and 128 are good ones to start with, and you can tweak it as you need.

Then you have to adjust the grid size: divide the number of points by the threads per block to give the number of blocks.

ECE 459 Winter 2024 13/20

#### Change the Launch

I did have to add a +1 to the number of blocks, because 100 000 does not divide evenly by 256.

ECE 459 Winter 2024 14 / 20

#### **Kernel Crash**

But just running it as-is didn't work (and led to the kernel crashing). Why?

Because the indexing strategy that I used contained only the reference to the block index blockIdx.x.

That's fine in the scenario where every work-item gets its own block, but that's no longer the case now: 256 work-items (points) now share each block.

ECE 459 Winter 2024 15 / 20

### **Updated Kernel**

```
extern "C" __global__ void calculate_forces(const float4* positions, float3*
    accelerations, int num_points) {
    int idx = threadIdx.x + blockIdx.x * blockDim.x;
    if (idx >= num_points) {
        return;
    }
    float4 current = positions[idx];
    float3 acc = accelerations[idx];
    for (int i = 0; i < num_points; i++) {
        body_body_interaction(current, positions[i], &acc);
    }
    accelerations[idx] = acc;
}</pre>
```

ECE 459 Winter 2024 16/20

#### With 100 000 points:

- nbody (sequential, no approximations): 40.3 seconds
- nbody-parallel (parallel, no approximations): 5.3 seconds
- nbody-cuda (parallel, no approximations): 9.5 seconds
- nbody-cuda-grid (parallel, no approx., grid): 1.65 seconds

Now that's a lot better!

ECE 459 Winter 2024 17/20

## **Trading Accuracy for Performance?**

One more item from previous ECE 459 student Tony Tascioglu.

A crowd favourite in ECE 459 is trading accuracy for performance.

NVIDIA GeForce gaming GPU's don't natively support FP64 (double).

- Native FP64 typically requires \$\$\$ datacentre GPUs.
- FP64 used to be locked in software, now missing in HW.
- Emulated using FP32 on gaming and workstation cards.

ECE 459 Winter 2024 18 / 20

## **Trading Accuracy for Performance?**

Using 32-bit floats rather than 64-bit doubles is typically a 16, 32 or even 64× speedup depending on the GPU!

Even more: 16 bit float instead of 32 bit is typically another 2× faster.

For many applications, double precision isn't necessary!

ECE 459 Winter 2024 19/20

# **Trading Accuracy for Performance?**

#### How dramatic is the difference?

GPU	FP32 GFLOPS	FP64 GFLOPS	Ratio
GeForce RTX 3090	35580	556	FP64 = 1/64 FP32
GeForce RTX 3080	29770	465	FP64 = 1/64 FP32
Radeon RX 6900 XT	23040	1440	FP64 = 1/16 FP32
Radeon RX 6800 XT	20740	1296	FP64 = 1/16 FP32
GeForce RTX 3070	20310	317	FP64 = 1/64 FP32
GeForce RTX 3060 Ti	16200	253	FP64 = 1/64 FP32

ECE 459 Winter 2024 20 / 20
